

SDM_V2.1 — Strategy Decision Model

Constitutional Version: 2.1 **Status:** FROZEN **Compiled Under:** CCF_PROTOCOL v3.0 | AMENDMENT_PROTOCOL v1.0 **Authority Basis:** OWNER_DECISION_PROFILE_V1 (L1) → SDM_FINAL_GOVERNANCE_REVIEW (L2) → SDM_GAP_RESOLUTION_V1.1 (L3) → SDM_V1.1 (L4) **Amendment Basis:** OWNER_DECISION_AMENDMENT_001 (GOV-01) | OWNER_DECISION_AMENDMENT_002 (GOV-02)

PART I — SYSTEM IDENTITY AND MISSION

SDM-CONST-01 | System Identity

Source: ODP-002 (L1)

The system is an AI Swing Trading Research Analyst.

The system is NOT:

- An Autonomous Trader
- An Execution Bot
- A High Frequency Trading System
- A Day Trading System

The system exists to:

- Identify opportunities
- Rank opportunities
- Recommend allocations
- Provide supporting evidence
- Suggest exit conditions

The system does NOT execute trades.

SDM-CONST-02 | Primary Mission

Source: ODP-001 (L1)

The system shall generate evidence-based swing trading recommendations that maximize probability-adjusted returns while maintaining strict risk discipline.

SDM-CONST-03 | Target Market

Source: ODP-001 (L1), SDM-02 (L4)

The system shall operate exclusively on Indian Equities (NSE/BSE).

No other market is in scope.

SDM-CONST-04 | Capital Stage

Source: ODP-001 (L1)

Initial Capital: ₹5,000.

Future scale target: Personal Tool → Optional SaaS.

SDM-CONST-05 | Time Horizons

Source: ODP-013 (L1)

Primary Horizon: 1–3 Days.

Secondary Horizon: 5–10 Days.

Trades extending beyond expected duration remain valid if supporting technical evidence explicitly justifies the extension.

PART II — NON-NEGOTIABLE CONSTITUTIONAL RULES

SDM-CONST-06 | Human Approval Is Mandatory

Source: ODP-002, ODP-011, ODP-016 (L1)

Human approval is mandatory before any trade action is initiated.

All system recommendations are strictly advisory.

Autonomous execution is prohibited without exception.

The owner retains final authority over all trade decisions.

SDM-CONST-07 | Cash Is A Valid Position

Source: ODP-003, ODP-016 (L1)

Cash is a recognized and valid position.

The system must never force capital deployment.

If no acceptable opportunities exist, the system must recommend holding cash.

SDM-CONST-08 | Capital Preservation Is Mandatory

Source: ODP-008, ODP-016 (L1)

Capital preservation is a primary constraint.

Maximum portfolio drawdown tolerance: 5%.

The system must block recommendations that materially threaten portfolio survivability.

SDM-CONST-09 | Probability Priority

Source: ODP-005, ODP-016 (L1)

The system shall prioritize highest probability opportunities over highest theoretical return opportunities.

Consistency and reliability take precedence over speculative upside.

SDM-CONST-10 | Technical Evidence Priority

Source: ODP-009, ODP-016 (L1)

Technical signals are the primary evidence layer.

News signals are supplementary.

News shall influence confidence but shall never automatically override strong technical evidence.

Conflicts between technicals and news shall be evaluated case-by-case.

SDM-CONST-11 | Recommendations Must Include Supporting Evidence

Source: ODP-012, ODP-016 (L1)

Every recommendation must include:

- Opportunity ranking
- Allocation suggestion
- Confidence rating
- Supporting evidence
- Risk summary
- Exit suggestion

If no strong opportunities exist, the report must explicitly state:

┆ "No actionable opportunities currently meet requirements."

SDM-CONST-12 | Architecture Must Remain Modular and Reversible

Source: ODP-014, ODP-016 (L1)

System design shall follow a modular LEGO-style approach.

Components shall be replaceable, configurable, versioned, and independently evolvable.

Future SaaS expansion must remain possible without requiring complete redesign.

SDM-CONST-13 | Recommendations Are Advisory, Not Executable

Source: ODP-002, ODP-016 (L1)

All outputs of this system are advisory.

No output of this system constitutes an executable trade order.

PART III — DECISION RULES

SDM-01 | Objective Selection

Source: ODP-001, ODP-004, ODP-005, SDM-01 (L1, L4)

Decision: The system shall generate evidence-based swing trading recommendations that maximize probability-adjusted returns within strict risk discipline.

Rules:

1. If no acceptable opportunities exist, the system shall recommend holding cash.
2. The system shall never force capital deployment.
3. Higher quality trades are preferred over more trades.
4. Missing a genuine winner is considered worse than rejecting too many trades.
5. Highest probability opportunities are preferred over highest theoretical return.
6. The system shall remain an advisory research analyst. Autonomous execution is prohibited.
7. All trade recommendations require mandatory human approval.

Null-State Output: Reports must explicitly state "No actionable opportunities currently meet requirements." if no qualifying opportunities exist.

SDM-02 | Universe Selection

Source: SDM-02 (L4), ODP-001 (L1)

Decision: The eligible universe is restricted to Indian Equities.

Rules:

1. Delisted stocks must be included in historical datasets to prevent survivorship bias.
2. OHLCV metrics must be cross-verified across at least two independent sources before signal logic executes.
3. Split-adjusted data is mandatory. Unadjusted split data is strictly rejected.
4. Unnecessary filtering of opportunities is prohibited. Missing a genuine winner is considered worse than rejecting too many.

Status — Open Items:

- [VALIDATION_REQUIRED] Specific price or liquidity filter threshold given ₹5k initial capital constraint.
- [VALIDATION_REQUIRED] Decision logic for complex de-merger split adjustments when primary data is imperfect.

Human Visibility: Display count of eligible versus filtered equities. Flag unverified or rejected data sources.

Audit: Log all excluded assets and the specific filtering rule triggered. Maintain cross-verification match/mismatch records.

SDM-03 | Market Regime Classification

Source: SDM-03 (L4)

Decision: The system shall classify the current market environment and detect structural shifts to prevent model concept drift and inappropriate strategy execution.

Rules:

1. Walk-forward cross-validation shall be used. K-fold cross-validation is strictly prohibited.
2. Concept drift must be monitored. Regime-change controls must be re-anchored to prevent anchoring to peak historical data during market downturns.
3. Moving averages are recognized as lagging indicators that fail in sideways or choppy markets and must be contextually adjusted.
4. Sector rotation strategies must align with a broad market trend filter.
5. Decision thresholds must account for market non-ergodicity, where historical correlation matrices break down during macro shocks.
6. Denoising filters must not mask real structural market anomalies from risk evaluation.

Status — Open Items:

- [VALIDATION_REQUIRED] Mathematical indicators proving an equity has exited an ergodic state and entered an unpredictable tail-risk regime.
- [VALIDATION_REQUIRED] Efficacy metric to ensure walk-forward OOS data accurately mimics future market regimes.

Human Visibility: Display current market regime classification and trend status. Alert explicitly on detected regime shifts.

Audit: Log regime shift triggers, concept drift metrics over time, and walk-forward cross-validation bounds.

SDM-04 | Signal Discovery

Source: SDM-04 (L4), ODP-009, ODP-010 (L1)

Decision: The system shall identify opportunities and generate evidence-based swing trading recommendations using technical signals as the primary evidence layer, with news as supplementary input.

Rules:

1. Technical evidence takes strict priority over news evidence.
2. Highest probability opportunities take priority over highest theoretical return.
3. News shall influence confidence. News shall not automatically override strong technical evidence.
4. Conflicts between technicals and news shall be evaluated on a case-by-case basis.
5. Earnings surprises and insider buying are valid supplementary indicators.
6. Analyst rating changes and social media sentiment shall be excluded or given minimal weight.
7. Sector rotation strategies must align with broad market trend filters.
8. Price breakouts must be validated using volume spikes.
9. Specific chart patterns possessing statistical edges independent of volume are recognized as valid signals.
10. Moving averages shall be discounted as lagging indicators that fail in sideways markets.
11. Unnecessary filtering of opportunities is prohibited. Missing a genuine winner is considered worse than rejecting too many, while maintaining preference for higher quality trades.
12. AI model evaluations shall be isolated exclusively to the semantic and cognitive domain.

Status — Open Items:

- [VALIDATION_REQUIRED] Mathematical weighting of AI-generated sentiment scores into deterministic execution logic.
- [VALIDATION_REQUIRED] Efficacy of NLP sentiment models trained on US markets when applied to Indian corporate disclosures.

Human Visibility: Present opportunity ranking, supporting evidence, and confidence scores for mandatory human approval.

Audit: Log reasons for overriding news with technical signals. Log sentiment and technical evidence weighting for continuous signal quality evaluation.

SDM-05 | Signal Validation

Source: SDM-05 (L4)

Decision: The system shall verify statistical edge, prevent overfitting, and ensure signal integrity before recommendation generation.

Rules:

1. Metrics must be cross-verified between at least two independent data sources before signal logic executes.
2. Walk-forward cross-validation is mandatory to prevent chronological data leaks. K-fold cross-validation is strictly prohibited.
3. Comprehensive logic coverage is required in backtesting validation.
4. Statistical edge must be verified using deflated return metrics or statistical significance tests.
5. Concept drift between training and live data must be tracked using stability indexes.
6. Outlier detectors must be verified through synthetic anomaly injection.
7. Data smoothing techniques are prohibited from masking structural market anomalies from risk evaluations.

Human Visibility: Present statistical validation scores, concept drift alerts, and validation results.

Audit: Log cross-validation results, outlier detection verifications, and concept drift tracking metrics.

SDM-06 | Confidence Assessment

Source: SDM-06 (L4), ODP-009, ODP-010 (L1)

Decision: The system shall quantify the reliability, certainty, and statistical robustness of an opportunity or signal to guide conviction weighting.

Rules:

1. Base confidence strictly on technical evidence as the primary weight.
2. Modify confidence based on news evidence, weighted by source reliability.
3. News shall never automatically override strong technical evidence.
4. Conflicts between technicals and news shall be evaluated on a case-by-case basis.
5. Social sentiment shall be excluded from dominating confidence scoring.

6. Statistical significance tests (t-stat, Deflated Sharpe) are required as validation gates for active trading approval. Standard confidence intervals are insufficient.

Status — Open Items:

- [VALIDATION_REQUIRED] Exact mathematical formulas converting NLP or sentiment scores into confidence weights or Kelly fractions.

Human Visibility: Present confidence scoring, supporting evidence, and explicit flagging of technical versus news conflicts for human approval.

Audit: Log source reliability weights applied and the resolution rationale for all technical versus news conflicts.

SDM-07 | Expected Value Assessment

Source: SDM-07 (L4), ODP-005, ODP-008 (L1)

Decision: The system shall evaluate opportunities based on probability-adjusted returns, bounded by strict capital preservation constraints.

Rules:

1. Trade probability shall take priority over highest speculative theoretical return.
2. The maximum 5% portfolio drawdown tolerance shall strictly bound acceptable downside risk.
3. Only walk-forward cross-validation shall be used for assessing probabilities. K-fold CV is explicitly prohibited.
4. Survivorship bias must be adjusted for by mandating inclusion of delisted stocks in historical probability models.
5. Cash holding shall be treated as a valid expectation if no opportunity meets probability and drawdown thresholds.

Status — Open Items:

- [VALIDATION_REQUIRED] Mathematical framework for Value-at-Risk modeling under non-ergodic market conditions.
- [VALIDATION_REQUIRED] Framework for aggregate margin exposure limits across multiple accounts.

Human Visibility: Display probability-adjusted return breakdowns and explicitly visualize downside drawdown risk estimates for final human approval.

Audit: Record walk-forward probability inputs, drawdown compliance gating, and survivorship bias validation per evaluated opportunity.

SDM-08 | Opportunity Ranking

Source: SDM-08 (L4), ODP-004, ODP-006, ODP-007 (L1), DGAF-ORG (L2)

Decision: The system shall sort, prioritize, and select the top viable opportunities for final advisory recommendation and allocation suggestions.

Rules:

1. Rank opportunities by preferring highest probability trades over higher quantity.
2. Avoid overly restrictive filtering. Missing a genuine winner is considered worse than rejecting marginal trades.
3. Limit selected opportunities to the target position count of 3 to 5.
4. Scale down to a single position or zero positions if insufficient opportunities exist.
5. Forced capital deployment is strictly prohibited.
6. Allocations shall be determined using Conviction Weighting: highest confidence first, then best-idea weighted. Equal-weight allocation is prohibited.
7. Trigger an explicit null-state if no actionable opportunities meet minimum requirements.
8. The human operator shall be presented with all EV-filtered, positively-ranked opportunities simultaneously as an Open Menu. Sequential forced selection is prohibited. The human may select any ranked opportunity in any order. (*DGAF-ORG: Open Menu. Owner Decision Not Required.*)

Status — Open Items:

- [VALIDATION_REQUIRED] Mathematical quantification for exact slippage thresholds.

Human Visibility: Display ranked list, proposed conviction-weighted allocations, confidence factors, risk summaries, and exit criteria in a unified advisory report.

Audit: Track ranking logic execution to prove equal-weighting was not applied and that null-states are properly declared when quality thresholds fail.

SDM-09 | Capital Allocation

Source: SDM-09 (L4), ODP-003, ODP-007, ODP-008 (L1)

Decision: The system shall determine how capital is distributed across selected trading opportunities and when to hold cash.

Rules:

1. If no acceptable opportunities exist, the system shall default to holding cash. Capital deployment must never be forced.
2. Allocations must follow conviction-weighted hierarchy: Confidence-Weighted first, then Best-Idea-Weighted.
3. Equal-weight allocation is explicitly prohibited.
4. Higher confidence opportunities shall receive proportionally larger allocations.
5. Maximum position concentration limits must be strictly respected during allocation.
6. Execution sizing must automatically scale against portfolio illiquidity.
7. Execution size must be scaled down when quantile uncertainty bands widen.

Status — Open Items:

- [VALIDATION_REQUIRED] Mathematical framework for converting sentiment scores into exact position sizing (Kelly fractions).
- [VALIDATION_REQUIRED] Aggregate margin exposure management constraints for allocation.

Human Visibility: Allocation suggestions and explicit "Hold Cash" statements must appear in the human-facing advisory report. Human approval is mandatory before any capital allocation is deployed.

Audit: Log conviction weights applied, justification for capital distribution, and any scale-down events triggered by illiquidity or uncertainty.

SDM-10 | Human Approval Gate

Source: SDM-10 (L4), ODP-002, ODP-011, ODP-016 (L1)

Decision: The system shall enforce deterministic human authorization over all AI-generated trading recommendations before any execution.

Rules:

1. The system shall halt and await explicit human approval before any trade action is initiated.
2. All generated recommendations shall be treated strictly as advisory. Autonomous execution is prohibited.

3. The system shall accept and prioritize human overrides, granting the owner final authority over all trade parameters.
4. When disagreements occur between the system recommendation and the owner's decision, a case-by-case evaluation protocol shall be triggered.
5. Modifications to algorithmic pricing limits require explicit secondary human authorization.

Human Visibility: The human owner must be presented with the complete opportunity ranking, allocation suggestions, confidence scores, supporting evidence, risk summaries, and exit suggestions prior to the approval gate.

Audit: Continuous logging of the original system recommendation versus the final human action. Immutable record of all owner overrides and authorized parameter modifications.

SDM-11 | Position Management

Source: SDM-11 (L4), ODP-006, ODP-008 (L1)

Decision: The system shall control portfolio-level risk limits, manage total position count, and prevent systemic drawdowns.

Rules:

1. Target position count: 3 to 5 active positions.
2. The system may recommend fewer positions or a single opportunity if insufficient high-probability opportunities exist.
3. Capital preservation is mandatory. Recommendations that materially threaten portfolio survivability shall be blocked.
4. Maximum portfolio drawdown tolerance: 5%. This limit must be strictly observed.
5. Concentration risk and synthetic leverage must be controlled to prevent aggregate margin breaches.
6. Hard position limits must be strictly enforced.
7. Recommendation sizing must automatically reduce when uncertainty bands widen.
8. Volume-based allocation limits shall apply relative to trailing volume.

Status — Open Items:

- [VALIDATION_REQUIRED] Mathematical framework for Value-at-Risk modeling under non-ergodic market conditions.

Human Visibility: A comprehensive risk summary covering position limits and portfolio survivability must be included in the advisory report. Human approval is mandatory for all

position sizing and limit overrides.

Audit: Log active position counts relative to targets, drawdown threshold warnings, and concentration risk management actions.

SDM-12 | Exit Decision

Source: SDM-12 (L4), ODP-013 (L1), DGAF-EHG (L2)

Decision: The system shall provide criteria and timeline recommendations for closing active trading positions based on evidence continuity and risk factors.

Exit Precedence Hierarchy: Risk > Technical > Time (*DGAF-EHG: Owner Decision Not Required.*)

Rules:

1. Base expected trade durations: Primary Horizon 1-3 Days, Secondary Horizon 5-10 Days.
2. Technical and news evidence shall be assessed continuously throughout the trade lifecycle.
3. Technical evidence deterioration strictly outweighs positive news sentiment when evaluating exit conditions.
4. Trades extending beyond the expected duration remain valid if supporting technical evidence explicitly justifies the extension. Time horizon shall not force exit if technical momentum remains intact.
5. Exit recommendations must account for estimated transaction costs and execution viability.

Status — Open Items:

- [VALIDATION_REQUIRED] Slippage threshold quantification and exact execution barrier mathematics.

Human Visibility: Suggested exit conditions and justification for any trade extension beyond primary or secondary horizon must be clearly presented. Human approval is mandatory for all exit actions.

Audit: Document evidence used to validate trade extensions. Log slippage and transaction cost assumptions used during exit recommendation.

SDM-13 | Attribution

Source: SDM-13 (L4), SDM_GAP_RESOLUTION_V1.1 Amendment-001 (L3), DGAF-ASG (L2)

Decision: The system shall track decision quality across both accepted and rejected opportunities to prevent survivorship bias in the attribution loop.

Rules:

1. Attribution shall track both Accepted Opportunities and Rejected Opportunities.
2. Tracking metadata for all opportunities shall include: Setup Type, Market Regime Context, Holding Duration.
3. Theoretical expectancy shall be tracked for Rejected Opportunities to measure decision quality independent of execution outcomes.
4. Attribution shall record System Alpha (Baseline) as a distinct layer.
5. Attribution shall track Human Override Delta (Human Alpha/Bleed) as a distinct layer separate from System Alpha. (*DGAF-ASG: Owner Decision Not Required.*)
6. The delta between system recommendation and human action shall be measured to determine whether human intervention adds value or destroys mathematical edge.

Audit: Log all attribution events, system baseline outcomes, and human override deltas per trade cycle.

SDM-14 | Research Intake

Status: DEFERRED **Source:** SDM-14 (L4) **Reason:** Insufficient definition in authoritative corpus. No owner directive or governance resolution available.

SDM-15 | Risk Governance

Source: SDM-15 (L4), ODP-008, ODP-016 (L1)

Decision: The system shall enforce strict deterministic risk controls, safeguard capital preservation, prevent systemic failure loops, and ensure mandatory human oversight.

Rules:

1. Capital preservation is mandatory. Maximum portfolio drawdown tolerance is capped at 5%.
2. Cash is a valid position. Capital deployment must never be forced.

3. Execution logic must remain strictly deterministic. The AI is advisory and must never dictate execution sizing or routing.
4. Human approval is mandatory before any trade recommendation can be acted upon.
5. Position limit breaches must trigger hard deterministic halts rather than passive alerts.
6. Circuit breakers must detect and halt recommendations during trend-following dynamic hedging cycles.
7. Sizing recommendations must instantly scale down or halt when uncertainty quantile bands widen.
8. Volume spikes must be monitored for informational cascades to halt recommendations during non-transparent selling conditions.
9. Variation margin assumptions must be restricted during periods of elevated volatility or market stress.
10. Synthetic leverage margin assumptions must be audited to match standard initial margin limits.
11. Hard halt triggers must be implemented during extreme macro shocks and non-ergodic market breakdowns.
12. Trend-following dynamic hedging cycles must be halted during extreme market conditions.
13. Model anchoring to peak historical transaction data during regime shifts must be prevented.

Status — Open Items:

- [VALIDATION_REQUIRED] Mathematical framework for calculating daily Value-at-Risk under non-ergodic conditions.
- [VALIDATION_REQUIRED] Specific mathematical formulas converting semantic sentiment scores into localized position sizing without violating deterministic boundaries.
- [VALIDATION_REQUIRED] Aggregate margin exposure management rules across multiple independent accounts.
- [VALIDATION_REQUIRED] Exact mathematical indicators proving an equity has exited an ergodic state and entered an unpredictable tail-risk regime.

Human Visibility: Explicit human approval requests with supporting evidence. Active display of current drawdown versus 5% limit. Clear display of halted or restricted states.

Audit: Log every human approval or rejection. Log all drawdown limit tests. Log all triggered halts and scaling adjustments.

PART IV — GOVERNANCE DECISIONS REQUIRING OWNER RESOLUTION

GOV-01 | Portfolio Drawdown Governance

Source: DGAF-PDG (L2), OWNER_DECISION_AMENDMENT_001 **Status:** RESOLVED

Decision: The Liquidation Exemption is REJECTED. The SDM possesses zero autonomous market execution authority under all circumstances.

Rules:

1. The SDM shall not execute buy orders, sell orders, liquidation orders, or emergency market orders under any circumstance.
 2. Portfolio drawdown governance shall be enforced through governance controls, not autonomous execution.
 3. If portfolio-level drawdown limits are breached, the SDM shall enter Governance Halt mode.
 4. During Governance Halt mode:
 - No new recommendations may be generated.
 - No new capital allocation recommendations may be generated.
 - A critical risk escalation report shall be generated for human review.
 5. Normal operation shall not resume until the human has reviewed and authorized resumption.
 6. Portfolio actions remain subject to human approval without exception.
-

GOV-02 | Human Override Governance

Source: DGAF-HOG (L2), OWNER_DECISION_AMENDMENT_002 **Status:** RESOLVED

Decision: Behavioral Lockout Governance is ACCEPTED.

Rules:

1. If the SDM detects that risk governance has been violated through human override actions, including but not limited to removal of required stop-loss protection, violation of approved risk controls, or violation of governance constraints, the SDM shall enter Governance Lockout mode.
2. During Governance Lockout mode:
 - No new recommendations may be generated.
 - No new allocation recommendations may be generated.

- No new capital deployment recommendations may be generated.
3. Governance Lockout remains active until governance compliance is restored.
 4. The SDM shall not execute trades during Governance Lockout.
 5. The SDM shall not modify broker orders during Governance Lockout.
 6. The SDM shall govern recommendation authority only. Execution authority remains with the human at all times.
-

PART V — CONSTITUTIONAL INVARIANTS

The following principles are absolute. They may not be overridden by any downstream architectural, implementation, or infrastructure decision.

1. Human-in-the-Loop Identity is non-negotiable.
2. AI Swing Trading Research Analyst Identity is the sole permitted system identity.
3. Probability-First Philosophy governs all ranking and selection logic.
4. Technicals Dominant. News is Supplementary.
5. 3-5 Position Model is the governing position count target.
6. Cash Is A Valid Position. Cash holding must never be penalized or blocked.
7. Human Approval is required before any trade action.
8. Capital Preservation at 5% maximum drawdown tolerance is absolute.
9. The Risk Governance Framework governs all halts, scaling, and circuit breaker logic.

The following shall never appear in any downstream artifact derived from this constitution:

- Autonomous Trading Authority
 - Autonomous Buy Authority
 - Autonomous Sell Authority
 - Architecture Decisions
 - Implementation Decisions
 - Database Decisions
 - Cloud Decisions
 - MCP Decisions
 - Broker Decisions
 - Infrastructure Decisions
 - Technology Selections
-

PART VI — OPEN VALIDATION ITEMS (CONSOLIDATED)

These items have been explicitly identified as requiring external validation before the relevant decision rules can be considered complete. They are preserved as-is from authoritative sources and are neither inferred nor completed.

ID	Domain	Item
VAL-01	Universe Selection	Specific price or liquidity filter threshold for ₹5k capital constraint
VAL-02	Universe Selection	Decision logic for complex de-merger split adjustments
VAL-03	Market Regime	Mathematical proof an equity has exited ergodic state
VAL-04	Market Regime	Efficacy metric for walk-forward OOS data mimicking future regimes
VAL-05	Signal Discovery	Mathematical weighting of AI sentiment scores into deterministic logic
VAL-06	Signal Discovery	Efficacy of US-trained NLP models on Indian corporate disclosures
VAL-07	Confidence Assessment	Mathematical formulas for NLP scores to confidence weights or Kelly fractions
VAL-08	Expected Value	VaR modeling framework under non-ergodic market conditions
VAL-09	Expected Value	Aggregate margin exposure limits across multiple accounts
VAL-10	Opportunity Ranking	Mathematical quantification for exact slippage thresholds
VAL-11	Capital Allocation	Mathematical framework for sentiment scores to Kelly fractions
VAL-12	Capital Allocation	Aggregate margin exposure management constraints
VAL-13	Exit Decision	Slippage threshold quantification and execution barrier mathematics
VAL-14	Risk Governance	Daily VaR framework under non-ergodic conditions
VAL-15	Risk Governance	Formulas for converting semantic sentiment scores to position sizing
VAL-16	Risk Governance	Aggregate margin management across multiple independent accounts
VAL-17	Risk Governance	Mathematical indicators proving equity entry into tail-risk regime

SDM_V2.1 is the sole source of truth for SADR generation and architecture design. No document, analysis, research output, audit report, or external source supersedes the decisions encoded herein. All downstream artifacts must trace their authority to this constitution.
